

We have been working with experimental FM radio broadcasting for a couple of years now, doing stuff such as sitespecific broadcasted sound pieces, temporary break-ins and free community (pirate)radio. We had an idea where we were to arrange a outdoor club in a park somewhere and invite people to bring their own portable radio receivers. We would then use our radio equipment to broadcast music throughout the night. The DJ and the radio equipment would be placed at an appropriate spot in safe distance from the park, perhaps in a van a couple of blocks away. In this way you would either have to shut down every single radiotransmitter or track down the dj and the transmitter to stop the music. This would be interesting as a collective situation but with no single physical music source and no concrete centre. For some reason (we dont really remember why) the project was never realized. We still think it is a sweet idea.
